DATE MAILED:

Please find below and/or attached an Office communication concerning this application or proceeding.

Commissioner for Patents

The drawing filed on 3/17/04 has been approved.

EXAMINER'S STATEMENT OF REASONS FOR ALLOWANCE

1. This communication is an Examiner's reasons for allowance in response to application filed on 3/17/04, assigned serial 10/802056 and title "Input system based on a three-dimensional inertial navigation system and trajectory estimation method thereof".

2. The following is the Examiner's statement of reasons for the indication of allowable subject matter:

After carefully reviewing the application in light of the amended claims and the additional search of all the possible areas relevant to the present application, a set of related prior art references has been found, but those prior art references are not deemed strong to make the application unpatentable. Thus, it is found that the application is now in condition for allowance.

As per claims 1, and 12, the prior art of record does not disclose an input system, and method based on a three-dimensional inertial navigation system and having an input part and a host device, and for detecting motion position information corresponding to three-dimensional motions of the input part and outputting the detected motion position information to the host device, comprising: a rotation angle information estimation-computing portion for estimating motion rotation angle information Φ , θ , and Ψ through a predetermined computing process based on the outputted pre-motion acceleration information and post-motion acceleration information; and a conversion-computing unit for calculating the motion position information based on the estimated motion rotation angle information and the outputted motion acceleration information. This limitation in combination with the other elements in the claim was not shown or suggested by the prior art.

As per claims 7, and 18, the prior art of record does not disclose an input system, and method based on a three-dimensional inertial navigation system and having an input part and a host device, and for detecting motion position information corresponding to three-dimensional motions of the input part and outputting the detected motion position information to the host device, comprising: a rotation angle information estimation-computing portion for estimating motion rotation angle information Φ , θ , and Ψ based on acceleration information based on gravitational acceleration separated from the outputted motion acceleration information; a conversion-computing unit for calculating motion position information based on the estimated motion rotation angle information and the outputted motion acceleration information. This limitation in combination with the other elements in the claim was not shown or suggested by the prior art.

Claims 1-22, are allowable over the prior art of record.
